

AMBEX 2005: Trade Review

NMI Safety Systems Ltd launched their latest Rear Impact Protection System, the Rotating King Rips (RKR) at Ambex this year. Following the huge success of their earlier models, NMI has launched not only the safest system for clients travelling in wheelchairs but the most flexible solution too.

The RKR offers a one-piece wheelchair station that doubles as a seat. This unique and innovative design facilitates the safe transportation of clients with the minimum disruption of seating capacity.

The RKR is a dedicated wheelchair station that cleverly slides on a base plate to accommodate the maximum number of wheelchair types and neatly rotates to store against the vehicle wall, giving the optimum aisle clearance needed to bring the wheelchair client between seating or stretcher. The RKR has the added bonus of rotating to 3 positions as an M1 tested seat, so can be utilised as an attendant seat when necessary in both PTS and A&E vehicles.

A large number of Ambulance Services are considering using the RKR. Mr. Dave Rigby, Education Training Manager for Lancashire Ambulance NHS Trust said "We have recently purchased the innovative RKR for our new vehicles. This revolutionary model has addressed issues created within the Ambulance Service for space and flexibility.

The RKR from NMI Safety Systems provides the only solution to the ever changing demands that face PTS Ambulance vehicles and gives the satisfaction of knowing clients are being transported in the safest way possible. "
